Abdulrahman H. Alsaafin
BSIT 4th Year – Set A

STEP 24 — FINAL REFLECTION

My Journey as a BSIT Student

Before entering the BSIT program, my understanding of Information Technology was mostly centered on computers, software, websites, and the basic use of technology. I knew that IT involved programming and computer systems, but I did not fully understand how many different areas were connected to the field. I had a general interest in technology, but I had not yet experienced the process of planning, developing, troubleshooting, documenting, and presenting complete IT projects.

One of the most important things I learned during BSIT is that IT is much broader than programming. I learned about databases, web development, networking, data analysis, system troubleshooting, cybersecurity, project development, documentation, and responsible use of technology. I also learned that solving an IT problem requires patience and a systematic approach. Instead of immediately guessing the answer, I learned to identify the problem, consider possible causes, gather evidence, test solutions, and verify the result. This problem-solving mindset is one of the most useful skills I gained from the program.

The project that taught me the most was my web development work because it required me to combine several skills at the same time. Building and improving websites helped me understand how frontend components, backend logic, databases, project files, and development tools work together. I also experienced the practical side of maintaining a project, such as managing dependencies, troubleshooting errors, checking the project structure, and making sure that changes actually worked. This experience taught me that creating a working application is different from simply writing code. A project needs planning, testing, organization, and continuous improvement.

The technical difficulty that challenged me most was troubleshooting problems in my development projects. Sometimes an issue was not caused by the part of the code I was currently looking at, and determining the actual cause required checking configurations, dependencies, files, or the environment. These experiences were frustrating at times, but they taught me to troubleshoot step by step instead of changing everything at once. I also learned that an error message is useful information rather than simply a problem to ignore.

My IT skills have changed significantly since I started BSIT. I am now more comfortable with programming concepts, web development, databases, troubleshooting, technical documentation, and project organization. I can also understand technical problems more systematically and communicate solutions more clearly. My experience with different projects has made me more confident in learning unfamiliar technologies. I have also learned to use AI tools responsibly as an assistant for brainstorming, explanations, coding support, and documentation while still verifying the results myself.

There are still many skills I need to improve. In particular, I want to strengthen my networking, Linux, cybersecurity, scripting, system administration, and security monitoring skills. I also want to improve my ability to work with larger and more complex systems. I know that graduating from BSIT does not

mean that learning is finished. Technology changes continuously, so I need to continue studying and practicing throughout my career.

The kind of IT professional I want to become is a cybersecurity professional. I am especially interested in defensive cybersecurity, where I can help protect systems, identify vulnerabilities, monitor threats, respond to incidents, and improve security practices. In the long term, I want to pursue a master's degree in cybersecurity so that I can develop deeper technical and academic knowledge in the field. I want my career to combine practical experience with continuous learning and specialization.

I believe I am now ready to begin my career in IT because BSIT has given me more than technical knowledge. It has taught me how to learn, troubleshoot, adapt, document my work, and take responsibility for the quality of my results. I may still have many things to learn, but I understand that an IT career is a continuous process of improvement. I am ready to begin at an entry-level position, gain real-world experience, learn from more experienced professionals, and continue developing my cybersecurity skills. My BSIT journey has given me a foundation, and I am ready to build on that foundation as I begin my professional career.
